

- A man cycles at a constant speed $u \text{ m s}^{-1}$ on level ground and finds that when his velocity is $u\mathbf{j} \text{ m s}^{-1}$ the velocity of the wind appears to be $v(3\mathbf{i} - 4\mathbf{j}) \text{ m s}^{-1}$, where v is a positive constant.

When the man cycles with velocity $\frac{1}{5}u(-3\mathbf{i} + 4\mathbf{j}) \text{ m s}^{-1}$, the velocity of the wind appears to be $w\mathbf{i} \text{ m s}^{-1}$, where w is a positive constant.

Find, in terms of u , the true velocity of the wind.

(7)

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

This image shows a full page of blank, lined paper. It features approximately 28 horizontal grey lines spaced evenly apart, typical of standard notebook paper. The lines extend across the entire width of the page, leaving small margins at the top and bottom. There are no vertical lines, text, or other markings present.

-
- This image shows a full page of blank, lined paper. It features approximately 20 evenly spaced horizontal grey lines across its entire width, providing a guide for handwriting or typing. The background is a clean, solid white color.

4. A particle of mass m is projected vertically upwards, at time $t = 0$, with speed U . The particle is subject to air resistance of magnitude $\frac{mgv^2}{k^2}$, where v is the speed of the particle at time t and k is a positive constant.

(a) Show that the particle reaches its greatest height above the point of projection at time

$$\frac{k}{g} \tan^{-1} \left(\frac{U}{k} \right). \quad (6)$$

(b) Find the greatest height above the point of projection attained by the particle. (6)

[illegible]

Diagram of a mechanical system. A horizontal beam of length $4a$ is pivoted at its left end, point A . A rod of length $2a$ and mass $4m$ is attached to the beam at a distance a from A . The rod makes an angle θ with the vertical dashed line at A . The other end of the rod is point B . A string is attached to B , goes up and over a pulley at the right end of the beam, and then hangs down to a mass m .

The end A of a uniform rod AB , of length $2a$ and mass $4m$, is smoothly hinged to a fixed point. The end B is attached to one end of a light inextensible string which passes over a small smooth pulley, fixed at the same level as A . The distance from A to the pulley is $4a$. The other end of the string carries a particle of mass m which hangs freely, vertically below the pulley, with the string taut. The angle between the rod and the downward vertical is θ , where $0 < \theta < \frac{\pi}{2}$, as shown in Figure 1.

- $$2mga(\sqrt{5-4\sin\theta}-2\cos\theta)+\text{constant}.$$
- (5)

- $$4\sin^3\theta - 6\sin^2\theta + 1 = 0. \quad (5)$$

- (c) Given that $\theta = \frac{\pi}{6}$ corresponds to a position of equilibrium, determine its stability. (5)

[illegible]

- (a) Show that $AP = \frac{5a}{3}$. (4)

(b) Show that $\frac{d^2x}{dt^2} + 4\omega \frac{dx}{dt} + 3\omega^2 x = 0$. (5)

- (c) Find the velocity, $\frac{dx}{dt}$, of P in terms of a, ω and t . (8)
